

Local Legend App - Buyer Journey Review

Objective:

The goal of this assignment was to complete a full user journey on the Local Legend app, identify a key user pain point, propose a relevant product improvement or feature, and define success metrics to evaluate impact.

User Goal (buyer):

As a customer, I want to quickly find a relevant service/product and purchase it.

Journey Summary (Buyer Flow):

- Download the app and proceed with login or guest mode
- Allowed basic permissions (location, notifications)
- Navigate to “Product/Service” section and selected “Categories”
- Explored service categories and listings
- Added a service to cart and attempted further actions (chat/call/order)

User Pain Point:

Buyers experience confusion and lack of trust during service discovery, which prevents them from proceeding to complete an order.

Evidence Supporting the Pain Point:

1. **Irrelevant service listings:** Chose a specific service category (AI Product Management service) returns unrelated items such as food products alongside actual services, which makes the user feel unreliable.
2. **Limited location information:** Seller distance is shown only in kilometers, without locality name, map view, or navigation option. This makes it difficult for users to assess feasibility or authenticity of the seller.
3. **Cart interaction inconsistency:** Items continue to get added when clicking the cart instead of allowing quantity control, which creates confusion.

Proposed Improvement:

1. **Intent - Based Service Discovery:** Improve service discovery, enforce strict separation between product and service listings at the data and search level to ensure service/product categories return only relevant results based on user intent.

2. **Add trust signals:** Display seller verification status, service type, and basic performance indicators (response rate or completed orders). Additionally add locality name and provide a clickable map link so users can verify the authenticity of the seller.

Success Metrics to measure the impact of this feature, the following metrics can be tracked:

1. **Search Result Click-Through Rate:** Measures relevance and effectiveness of service discovery.
2. **Seller Profile View Rate:** Indicates buyer interest and trust in listings.
3. **Chat / Call Initiation Rate:** Reflects user confidence in engaging with sellers.
4. **Add-to-Cart to Login Conversion Rate(for guest):** Measures how effectively the platform motivates users to proceed toward transaction.

What Works Well:

- Guest login for new users.
- Seller profile layout is clean and easy to scan.
- Core buyer actions (add to cart, chat, call) are clearly visible and accessible.

Conclusion:

The primary opportunity lies in improving trust and clarity during service discovery. By delivering more relevant listings and providing stronger seller credibility signals, the platform can significantly improve buyer engagement, interaction rates, and overall marketplace conversion.
